Universal Forest Products®

Universal: Framing success one customer at a time.

Site-Built Construction

Universal Forest Products has built a reputation for designing and manufacturing premium building components, and for the unparalleled service and expertise that come with them. That's why the nation's leading builders — and regional builders from coast to coast — turn to Universal to help build their homes, apartments, commercial buildings and success.

Universal is known for designing innovative, engineered building products and for supplying components exactly when and where they're needed. We're also known for driving costs out of products and processes. That means we can help our customer's bottom line while making sure our products meet and exceed codes and expectations.

Universal offers a range of floor trusses, roof trusses, wall panels and floor systems that simplify building projects. Take our revolutionary

Open Joist®. Its finger-jointed, open-web design provides superior load-carrying capability. In addition, the design allows electrical, plumbing and HVAC systems to be "threaded" through the webs, concealing them from view.

Here are some of our other products:

Roof Trusses

Our roof trusses reduce the variables of building, because they're designed to your specifications. And you save valuable time by using these preassembled components on site.

Framing

Universal is your single source for all framing needs. We do it all, from roofs, walls and floors to installation. We provide materials and engineered wood components, design and engineering services, construction management, and installation labor for your framing project.

Wall Panels

Like our other engineered wood products, our wall panels save you time, money and guesswork. All of our wall panels are developed by skilled technicians using sophisticated computer modeling software. The software assists with the development of accurate shop drawings that are then used to fabricate the wall panels to a building designer's specific requirements. The result? Building components precision fitted to exact specifications. You'll receive a layout for a complete wall system with framed-in openings for windows, doors and headers, exactly as detailed on the plans.

I-Joists

Universal carries a complete line of I-joists for all applications — from solid-sawn flanges to LVL flanges. Stronger, straighter, and more consistent in quality than dimension lumber, our I-joists are lightweight and yield less waste during installation.

OPEN JOIST®

Open Joist from Universal Forest Products is a revolutionary, open-web, all-wood floor truss engineered for long spans and superior load-carrying capabilities. Open Joist is lightweight, safe to handle and can be trimmed on the job site for exact fit.

Open Joist trusses are individually tested to more than twice their strength. Precision finger joinery and waterproof structural adhesive are used in Open Joist's assembly process to produce a stronger, more resilient wood-to-wood connection, resulting in enhanced floor system performance.

Plated Floor Trusses

Universal's open-web trusses are custom made to fit exact specifications, so you won't have to cut them on the job. As with Open Joist, our plated trusses' open-web configuration allows builders to easily install mechanical systems.

About Universal

Forest Products

Universal has provided high-quality, competitively priced wood products since 1955. Our lumber and panel products range from pressure-treated and untreated wood to OSB and plywood. Our network of reputable suppliers and our design, engineering and distribution expertise allow us to improve your job scheduling while helping you improve the way you build. And that translates into greater efficiency and greater profit — and greater growth.

Universal Forest Products is a Midwestern company with a strong work ethic and a passion for being the best in everything we do, from the production floor to the sales office. We'd like the chance to show you how we can help build your success.
